

# ***Recycling***

**Recycling is making use of old products into new ones and prevents wasting of useful materials and reduces fresh raw-material consumption. Recycling was known to be practiced as early as 400 B.C. The recycling in the olden days has been re-use of scarce raw materials such as potteries, broken tools and ash.**

**There are several advantages in re-use of the existing products. Recycling wood, paper saves trees and helps in having fresh air. Many of the rainforests are gone and we are losing many more right now. So we need to make our stand to protect the earth and to do that we need to recycle.**

**Recycling keeps the earth clean and helps coming generations. Recycling will also help us prevent global warming. If all of us recycle it will save one million trees. If we don't recycle paper or any other tree products we won't be able to breathe because our fresh air comes from trees.**

**We can recycle most of the stuff we use in our every day lives. (Eg. Used Cars, Steel, Paper, Batteries, Wood, Metal, Soda Cans, Plastic, Computers, Books, CDs, Cardboard)**

**This is my essay, I hope you will pass the practice of recycling down for future generations.**

**Recycling by Anvesh Mylavarapu, Little River Elementary School**
